#### Abstract

An unprecedented dearomatization of [2.2]-paracyclophane-derived cyclic $N$-sulfonylimines was conducted through cyclopropanation with sulfur ylides, giving a series of dearomative cyclopropanes with good yields. DFT calculations suggested that the dearomatization was attributed to the relatively weak aromaticity of [2.2]paracyclophane derivatives that resulted 

Dearomatization of [2.2]Paracyclophane  from the effect of the unique [2.2]paracyclophane skeleton and the electron-withdrawing $N$-sulfonyl group. Some downstream elaborations of the products were demonstrated.

## ■ INTRODUCTION

Aromatic compounds can serve as bulk feedstocks in the chemical industry and play an important role in fundamental building blocks of living systems. The selective dearomatization reactions of the planar aromatic compounds provide a unique approach to access valuable three-dimensional molecules. ${ }^{1}$ Dearomatization of heteroaromatics containing N or O atoms and phenols has progressed tremendously. ${ }^{1}$ By contrast, there are few reports on the dearomatization of the carbocyclic rings of other arenes and their derivatives owing to dramatically improved resonance stabilization energy. ${ }^{2}$ The [2.2]paracyclophane derivatives are widely prevalent in materials science. ${ }^{3}$ In addition, they also could be used as chiral auxiliaries and ligands in stereoselective synthesis and asymmetric catalysis. ${ }^{4}$ [2.2]Paracyclophane incorporates two highly strained benzene rings, which are locked by two ethylene bridges at their para-positions. ${ }^{5}$ As a result of their ubiquitous scaffold, [2.2]paracyclophane derivatives can show unexpected chemical reactivities ${ }^{6,7}$ and unique stereochemical features (planar chirality). ${ }^{6 c}$ Compared with other reactions, the dearomatization of [2.2]paracyclophanes has been less explored. Of the limited reports, Diels-Alder cycloaddition, ${ }^{6 \mathrm{~b}}$ hydrogenation, ${ }^{6 \mathrm{c}}$ Birch reduction ${ }^{6 \mathrm{~d}-\mathrm{f}}$ and carbene addition ${ }^{6 \mathrm{~g}, \mathrm{~h}}$ are reliable strategies. However, these reactions require harsh reaction conditions or afford a complex product mixture. In this regard, developing a mild and effective protocol for dearomatization of [2.2] paracyclophanes would diversify the [2.2]paracyclophane derivatives, which can serve as potential candidates for new [2.2]paracyclophane-derived ligands and materials that would be otherwise difficult to be prepared.

Recently, we had developed the kinetic resolution of the [2.2]paracyclophane-derived cyclic $N$-sulfonylimines. ${ }^{8}$ During the course of this study, we attempted the aziridination of [2.2]paracyclophane-derived cyclic $N$-sulfonylimines with sulfur ylides. ${ }^{9}$ To our surprise, no aziridine product was detected. The dearomatization was accompanied by cyclo-
propanation of the carbocyclic aromatic ring, affording 3a with $76 \%$ yield (Scheme 1). This discovery suggested that the sulfur

Scheme 1. Reaction of [2.2]Paracyclophane Derivatives with Sulfur Ylides and Dearomatization of [2.2]Paracyclophane Motif

ylides were capable of disrupting the aromaticity of the carbocyclic ring. In this context, we began to study the dearomatization of [2.2]paracyclophane-derived cyclic N sulfonylimines with sulfur ylides.

## RESULTS AND DISCUSSION

To begin our investigation, [2.2]paracyclophane-derived cyclic N -sulfonylimine rac-1a (1.0 equiv) and sulfonium salt 2a (2.0 equiv) were chosen as model substrates. When the reaction was conducted in $\mathrm{N}, \mathrm{N}$-dimethylformamide (DMF), a series of

[^0]
bases were examined. The reactions were shut down when triethylamine and lithium carbonate were used as the base (Table 1, entries 1 and 5). Using potassium hydroxide as the

${ }^{a}$ Reaction conditions: rac-1a ( 0.10 mmol ), sulfonium salt 2a ( 0.20 mmol, 2.0 equiv), base ( $0.30 \mathrm{mmol}, 3.0$ equiv), solvent ( 2.0 mL ), 47 h. ${ }^{b}$ Determined by ${ }^{1} \mathrm{H}$ NMR spectroscopy using $1,3,5$-trimethoxybenzene as internal standard. ${ }^{c}$ Yield of rac-3a (brsm) $=$ yield of rac3a/conversion of rac-1a.
base led to an increase in the conversion of rac-1a, but the system was complex and only moderate $45 \%$ yield of rac-3a was obtained (entry 2 ). When sodium carbonate was also examined, the dearomatization was sluggish (entry 4). Potassium carbonate was found to be the optimal base after the screening of various bases (entry 3). Next, the effect of different solvents was tested. Acetonitrile and dichloromethane led to low reactivity (entries 6 and 7). Switching the solvent to ethanol gave only trace amount of rac-3a (entry 8). Thus, the next screening was focused on the mixed solvents. When the ratio of acetonitrile/ $N, N$-dimethylformamide was $1: 1$, the yield of rac-3a (based on recovered starting materials) was increased up to $91 \%$ (entry 9). Hence, the optimal conditions were established: $\mathrm{K}_{2} \mathrm{CO}_{3}$ (3.0 equiv), $\mathrm{CH}_{3} \mathrm{CN} / \mathrm{DMF}$ (1:1).
With the optimized conditions in hand, we evaluated the substrate scope and generality (Table 2). A series of sulfonium salts were examined. Ester- and amide-bearing sulfonium salts exhibited high activities, resulting in the formation of dearomative product 3a-3e with excellent yields (entries 1$5)$. When $R^{3}$ was benzoyl, no reaction occurred under the standard conditions (entry 6). The reaction of a sulfonium salt bearing a cyano group was complex (entry 7). These unsatisfactory results might be ascribed to the electronic effect of the functional groups in the sulfonium salts. Then, a broad range of [2.2] paracyclophane-derived cyclic N -sulfonylimines rac- $\mathbf{1}$ were explored. The imines containing $3-\mathrm{MeC}_{6} \mathrm{H}_{4}$ or 4 $\mathrm{MeC}_{6} \mathrm{H}_{4}$ were also well tolerated (Table 2, entries 8-9). Imine bearing electron-donating groups ( $R^{1}=4-\mathrm{MeOC}_{6} \mathrm{H}_{4}$ ) showed lower reactivity than those bearing electron-withdrawing groups ( $R^{1}=4-\mathrm{FC}_{6} \mathrm{H}_{4}, 4-\mathrm{ClC}_{6} \mathrm{H}_{4}, 3-\mathrm{FC}_{6} \mathrm{H}_{4}, 3-\mathrm{ClC}_{6} \mathrm{H}_{4}$ ), giving the dearomative product 3 k in $83 \%$ yield in 113 h (entry 11). Additionally, the reactions proceeded smoothly when $R^{1}$ was other halogen group ( $R^{1}=4-\mathrm{BrC}_{6} \mathrm{H}_{4}, 4-\mathrm{IC}_{6} \mathrm{H}_{4}$ ), the desirable products $3 \mathrm{~m}-3 \mathrm{n}$ were obtained with moderate yields (entry 13-14). The naphthyl group was also tolerated (entry 17). 8Substituted [2.2]paracyclophane-based $N$-sulfonylimine was

Table 2. Substrate Scope

${ }^{a}$ Reaction conditions: rac-1 $(0.20 \mathrm{mmol})$, sulfonium salt 2 ( 0.40 $\mathrm{mmol}, 2.0$ equiv), $\mathrm{K}_{2} \mathrm{CO}_{3}\left(0.60 \mathrm{mmol}, 3.0\right.$ equiv), $\mathrm{CH}_{3} \mathrm{CN}(2.0 \mathrm{~mL})$, DMF $(2.0 \mathrm{~mL}) .{ }^{b}$ Isolated yield. ${ }^{c} 3 \mathrm{c}: 3 \mathrm{c}^{\prime}=23.3: 1 .{ }^{d}$ The system is complex. ${ }^{e}$ The reaction was conducted at 1.0 mmol scale.
synthesized to further estimate the substrate scope. Probably owing to steric effects, a moderate $49 \%$ yield was observed when the reaction was extended to 113 h (entry 18). The structures and relative configurations of $3 \mathbf{a}$ and $3 \mathbf{c}^{\prime}$ were verified by the single crystal X-ray crystallographic analysis. ${ }^{10,11}$ When this dearomatization was conducted on a 1.0 mmol scale under standard conditions, the yield and enantioselectivity of product $3 \mathbf{j}$ could be retained (entry 19).

Furthermore, a preliminary study on the enantioselective version of this dearomatization reaction was also tried. Using the planar-chiral [2.2]paracyclophane-derived cyclic $N$-sulfonylimine $\left(R_{\mathrm{p}}\right)$-1a synthesized by our group, ${ }^{8 \mathrm{~b}}$ the desirable chiral product $(S, S, S)$-3a could be obtained with $99 \%$ ee and $80 \%$ yield (Scheme 2).

Control experiments were performed to probe the specificity of substrate 1 (Scheme 3). Under the above standard conditions, [2.2]paracyclophane aldimine $4 \mathbf{a}$ reacted with two equivalents of sulfonium salt $\mathbf{2 a}$ to give the aziridination 5 a in $80 \%$ yield (eq 1). In addition, 4 a reacted with two equivalents of sulfonium salt 2 d bearing amide to give the

$80 \%$ yield, $99 \%$ ee

## Scheme 3. Control Experiments

aziridination $\mathbf{5 b}$ in $75 \%$ yield (eq 2), no dearomative product was observed. The single-crystal of $\mathbf{5 b}$ was successfully obtained and confirmed the structure and relative configuration. ${ }^{12}$ The result accounted for the preferential reaction of the benzene ring with the sulfur ylide in substrate 1 . When $R^{1}$ was aryl, the imine moiety of substrate 1 did not react with sulfur ylide, probably owing to steric effects. The reaction of simple cyclic ketimine $\mathbf{4 b}$ with $\mathbf{2 a}$ generated the only aziridination product 5 c in $94 \%$ yield (eq 3), which shows that both the [2.2] paracyclophane skeleton and ketimine had a critical role in dearomatization of [2.2] paracyclophane imines 1.

To demonstrate the synthetic versatility of dearomative product 3a, some downstream transformations of 3a were conducted (Scheme 4). Selective reduction of 3a with sodium borohydride delivered the amine 6 in $95 \%$ yield and $>20: 1$ $\mathrm{dr}{ }^{8 \mathrm{~b}}$ Through coordination activation in the presence of Lewis acid boron trichloride, product 7 was obtained with $81 \%$ yield when dimethylamine was used as the nucleophile. The singlecrystal of product 7 was successfully obtained and confirmed the structure and relative configuration. ${ }^{13}$

Parallel to experimental studies, density functional theory (DFT) calculations were performed to gain further mechanistic insights into the reaction and stereoselectivity. Here, some possible pathways leading to four different stereogenic products were explored in detail. As illustrated in Scheme 5, the sulfur ylide initially undergoes electrophilic addition with 1a. Based on the configuration of possible products, four possible transition states $\left(\mathrm{TS}_{S 1}, \mathrm{TS}_{R 1}, \mathrm{TS}_{S 2}\right.$, and $\mathrm{TS}_{R 2}$, see Scheme 5 and Figure S6) were identified for the first $\mathrm{C}-\mathrm{C}$ bond formation. Among the four transition states, TS1 $1_{S 1}$ was calculated to have the lowest barrier ( $20.0 \mathrm{kcal} / \mathrm{mol}$, see the
black line in Scheme 5), followed by $\mathrm{TS1}_{R 1}$, the barrier of which is $2.2 \mathrm{kcal} / \mathrm{mol}$ higher. Interestingly, both $\mathrm{TS}_{S 1}$ and $T S 1_{R 1}$ are involved in $\mathrm{C}=\mathrm{C}$ bond activation, rather than $\mathrm{C}=$ N bond activation. Compared to $\mathrm{TS}_{R 1}, \mathrm{TS}_{S 2}$, and $\mathrm{TS}_{R 2}$ have even higher barriers, in which the sulfur ylide adds to the $\mathrm{C}=$ N bond of 1a to finish the aziridination of cyclic N sulfonylimines.

As for each pathway, the first $\mathrm{C}-\mathrm{C}$ bond formation leads to the generation of an intermediate. Four different intermediates (Int $1_{S 1}, \operatorname{Int} 1_{R 1}, \operatorname{Int} 2_{S 2}$, and Int $2_{R 2}$, see Scheme 5) were located. At Int $1_{S 1}$, an intramolecular $S_{N} 2$-like step via a new transition state $\mathrm{TS} 2_{S_{1}}$ occurs, involving the departure of $\mathrm{S}(\mathrm{Me})_{2}$ and enabling the formation of the observed dearomative $(S, S, S)$ product $\operatorname{Prod}_{S 1}$. The total barrier of TS2 $2_{S 1}$ was calculated to be $15.0 \mathrm{kcal} / \mathrm{mol}$ relative to that of 1a plus the sulfur ylide. Three other transition states leading to different stereogenic products were also located and are presented in Scheme 5. Taken together, the computational results support the formation of the ( $S, S, S$ )-product as the most favored product, which is consistent with the experimental findings.

To confirm the disruption of the aromaticity in the cyclopropanation process, quantitative evaluations of the aromaticity of several compounds were performed. Two suggested measurements of aromaticity, namely multicenter bond indices (B3LYP/6-31G**) ${ }^{14}$ and $\operatorname{NICS}(1)_{\text {ZZ }}$ (the ZZ tensor component of the nuclear independent chemical shift values at the points $1 \AA$ above the ring center) (B3LYP/6$\left.31+\mathrm{G}^{* *}\right)$ were chosen as the aromatic indices in this study. ${ }^{15}$ Although the strong aromaticity of the selected benzene ring in 1a and 5 a is exemplified by the negative $\operatorname{NICS}(1)_{Z Z}$ values ( -22.297 and -24.716 ) and large multicenter bond indices ( 0.056 and 0.066 ), it is also evident that the presence of the sulfonyl imine group and the paracyclophane skeleton in 1a weakens the aromaticity of the benzene ring when compared to 1a and 5a with [2.2]paracyclophane (see Scheme 6). As expected, the aromaticity of the benzene ring in 3 a is destroyed, as indicated by the $\operatorname{NICS}(1)_{\mathrm{ZZ}}$ value and multicenter bond index of the ring, which are -0.863 and 0.008 , respectively, typical values of a nonaromatic ring.

## - CONCLUSIONS

In conclusion, we have successfully developed an unprecedented dearomatization of the [2.2]paracyclophane-derived cyclic $N$-sulfonylimines via selective clopropanation with the sulfur ylides, giving the dearomative cyclopropane products with high site selectivity and diastereoselectivity in good yields. The mild conditions rendered this methodology compatible with diverse functional groups. Moreover, the diversification of the dearomative products was demonstrated, further showcasing the potential synthetic utility. We anticipated this methodology would provide a new platform for selective dearomatization of readily available [2.2]paracyclophane derivatives.

## EXPERIMENTAL SECTION

General Methods. All reactions were carried out under an atmosphere of nitrogen using standard Schlenk techniques, unless otherwise noted. Commercially available reagents were used without further purification. Solvents were treated prior to use according to the standard methods. ${ }^{1} \mathrm{H}$ NMR, ${ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\}$ NMR and ${ }^{19} \mathrm{~F}\left\{{ }^{1} \mathrm{H}\right\}$ NMR spectra were recorded at room temperature in $\mathrm{CDCl}_{3}$ on a 400 MHz instrument with tetramethylsilane (TMS) as the internal standard. Enantiomeric excess was determined by HPLC analysis, using chiral column described below in detail. Optical rotations were measured by polarimeter. X-ray crystallography data were collected using a Bruker D8 Venture with 3.0 ius cu and 3.0 ius mo. Flash column chromatography was performed on silica gel (200-300 mesh). The heat source for all heating reactions is the oil bath. High-resolution mass spectrometry (HRMS) was measured on an electrospray ionization (ESI) apparatus using the time-of-flight (TOF) mass spectrometry. All reactions were monitored by TLC analysis.

Materials. The [2.2]paracyclophane-derived $N$-sulfonylimines $\mathbf{1}$ were prepared according to the known methods. ${ }^{8 \mathrm{~b}}$ The sulfonium salts 2 were prepared according to the literature procedure. ${ }^{16,17}$

General Procedure for Dearomatization of [2.2]Paracyclophanes. A mixture of [2.2]paracyclophane-derived cyclic $N$-sulfonylimines $1(0.20 \mathrm{mmol})$, sulfonium salts $2(0.40 \mathrm{mmol}, 2.0$ equiv) and potassium carbonate ( $83 \mathrm{mg}, 0.60 \mathrm{mmol}, 3.0$ equiv) in acetonitrile ( 2.0 mL ) and $N, N$-dimethylformamide ( 2.0 mL ) was stirred at $15^{\circ} \mathrm{C}$ for $12-113 \mathrm{~h}$. Then ethyl acetate ( 10 mL ) and water $(10 \mathrm{~mL})$ were added. The organic layer was separated, and the aqueous layer was extracted with ethyl acetate $(20 \mathrm{~mL} \times 3)$. The combined organic layer was dried over anhydrous sodium sulfate, filtered, and concentrated under reduced pressure. The crude residue was purified by flash chromatography on silica gel using hexanes and ethyl acetate or hexanes and dichloromethane as eluent to give the desired dearomative products 3 .

Ethyl 4-Phenyl-6a,7a-dihydro-7H-(5,7a)-cyclopropa[3,4]benzo-[1,2-e][1,2,3]oxathiazina-(1,4)-benze-nacyclohexaphane-7-carbox-ylate-2,2-dioxide ( 3 a ). $76 \mathrm{mg}, 80 \%$ yield, $>20: 1$ dr, yellow solid, mp $=226-228{ }^{\circ} \mathrm{C}$, new compound, $R_{\mathrm{f}}=0.45$ (hexanes/ethyl acetate $=$ 5:1). ${ }^{1} \mathrm{H}$ NMR $\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.59-7.46(\mathrm{~m}, 3 \mathrm{H}), 7.44-7.37$ $(\mathrm{m}, 2 \mathrm{H}), 7.26-7.23(\mathrm{~m}, 1 \mathrm{H}), 7.18-7.44(\mathrm{~m}, 1 \mathrm{H}), 7.09-7.03(\mathrm{~m}$, $1 \mathrm{H}), 6.89-6.83(\mathrm{~m}, 1 \mathrm{H}), 5.01(\mathrm{~d}, J=7.0 \mathrm{~Hz}, 1 \mathrm{H}), 4.20(\mathrm{q}, J=7.1 \mathrm{~Hz}$, 2H), $3.23-3.12(\mathrm{~m}, 1 \mathrm{H}), 2.88-2.51(\mathrm{~m}, 4 \mathrm{H}), 2.47(\mathrm{t}, J=6.6 \mathrm{~Hz}$, $1 \mathrm{H}), 2.17-2.00(\mathrm{~m}, 2 \mathrm{H}), 1.75-1.63(\mathrm{~m}, 1 \mathrm{H}), 1.53(\mathrm{~d}, J=6.1 \mathrm{~Hz}$,

Experiment at 1.0 mmol Scale. A mixture of [2.2]-paracyclophane-derived cyclic $N$-sulfonylimine $\mathbf{1 d}(407 \mathrm{mg}, 1.0$ mmol ), sulfonium salt 2a ( $456 \mathrm{mg}, 2.0 \mathrm{mmol}, 2.0$ equiv) and potassium carbonate ( $415 \mathrm{mg}, 3.0 \mathrm{mmol}, 3.0$ equiv) in acetonitrile $(10 \mathrm{~mL})$ and $N, N$-dimethylformamide $(10 \mathrm{~mL})$ was stirred at $15^{\circ} \mathrm{C}$ for 19 h . Then ethyl acetate $(30 \mathrm{~mL})$ and water $(30 \mathrm{~mL})$ were added. The organic layer was separated, and the aqueous layer was extracted with ethyl acetate $(30 \mathrm{~mL} \times 3)$. The combined organic layer was dried over anhydrous sodium sulfate, filtered and concentrated under the reduced pressure. The crude residue was purified by flash chromatography on silica gel using hexanes and ethyl acetate as eluent to give the desired dearomative product 3 j 364 mg , $74 \%$ yield.

Dearomatization of Chiral $N$-Sulfonylimine. A mixture of [2.2] paracyclophane-derived cyclic $N$-sulfonylimine $\left(R_{p}\right)$-1a $(78 \mathrm{mg}$, $0.20 \mathrm{mmol}, 99 \% \mathrm{ee}$ ), sulfonium salt 2a ( $91 \mathrm{mg}, 0.40 \mathrm{mmol}, 2.0$ equiv) and potassium carbonate ( $83 \mathrm{mg}, 0.60 \mathrm{mmol}, 3.0$ equiv) in acetonitrile $(2.0 \mathrm{~mL})$ and $N, N$-dimethylformamide $(2.0 \mathrm{~mL})$ was stirred at $15{ }^{\circ} \mathrm{C}$ for 47 h . Then ethyl acetate $(10 \mathrm{~mL})$ and water ( 10 mL ) were added. The organic layer was separated, and the aqueous layer was extracted with ethyl acetate $(10 \mathrm{~mL} \times 3)$. The combined organic layer was dried over anhydrous sodium sulfate and concentrated under reduced pressure. The residue was purified by flash chromatography on silica gel using hexanes and dichloromethane as eluent to give chiral product $(S, S, S)$ - $\mathbf{3 a}$.
(+)-(S,S,S)-Ethyl 4-Phenyl-6a,7a-dihydro-7H-(5,7a)-cyclopropa-[3,4]benzo[1,2-e][1,2,3]oxathiazina-(1,4)-benzenacyclohexaphane-7-carboxylate-2,2-dioxide (3a). $75 \mathrm{mg}, 80 \%$ yield, $>20: 1 \mathrm{dr}$, yellow solid, $R_{\mathrm{f}}=0.50$ (hexanes/ethyl acetate $=5: 1$ ), $99 \%$ ee, $[\alpha]_{\mathrm{D}}^{20}=$ +821.32 ( c 1.38, $\mathrm{CHCl}_{3}$ ). HPLC (Chiralpak IA column, $n$-Hexane/ $i$ $\operatorname{PrOH}=60 / 40$, flow $\left.=0.6 \mathrm{~mL} / \mathrm{min}, \mathrm{l}=254 \mathrm{~nm}, 30^{\circ} \mathrm{C}\right) t_{\mathrm{R}}=8.4 \mathrm{~min}$ (major), 11.4 min (minor).

Aziridination of Cyclic $\boldsymbol{N}$-Sulfonylimines. A mixture of [2.2] paracyclophane-derived cyclic $N$-sulfonylimine 4a ( $63 \mathrm{mg}, 0.20$ mmol ), sulfonium salt 2 a ( $91 \mathrm{mg}, 0.40 \mathrm{mmol}, 2.0$ equiv) and potassium carbonate ( $83 \mathrm{mg}, 0.60 \mathrm{mmol}, 3.0$ equiv) in acetonitrile $(2.0 \mathrm{~mL})$ and $N, N$-dimethylformamide $(2.0 \mathrm{~mL})$ was stirred at $15^{\circ} \mathrm{C}$ for 12 h . Then ethyl acetate $(10 \mathrm{~mL})$ and water $(10 \mathrm{~mL})$ were added to the mixture. The organic layer was separated and the aqueous layer was extracted with ethyl acetate $(10 \mathrm{~mL} \times 3)$. The combined organic
layer was dried by anhydrous sodium sulfate and concentrated under reduced pressure. The residue was purified by flash chromatography on silica gel using hexanes and dichloromethane as eluent to give the corresponding aziridination product $5 \mathbf{5}$.
Ethyl 1,8b-Dihydro-azirino[1,2-c][2.2]paracyclophano[5,6-d]-[1,2,3]oxathiazina-1-carboxylate-3,3-dioxide (5a). $64 \mathrm{mg}, 80 \%$ yield, $>20: 1 \mathrm{dr}$, white solid, $\mathrm{mp}=63-65^{\circ} \mathrm{C}$, new compound, $R_{\mathrm{f}}=$ 0.60 (hexanes/dichloromethane = 1:1). ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.00-6.95(\mathrm{~m} \mathrm{1H}), 6.75-6.70(\mathrm{~m}, 1 \mathrm{H}), 6.68-6.59(\mathrm{~m}, 2 \mathrm{H}), 6.55$ $(\mathrm{d}, J=7.9 \mathrm{~Hz}, 1 \mathrm{H}), 6.43(\mathrm{~d}, J=7.9 \mathrm{~Hz}, 1 \mathrm{H}), 4.38-4.24(\mathrm{~m}, 2 \mathrm{H})$, $4.02(\mathrm{~d}, J=3.7 \mathrm{~Hz}, 1 \mathrm{H}),{ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\} \mathrm{NMR}\left(100 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 165.8$, 149.0, 140.3, 139.8, 138.1, 136.7, 133.5, 132.6, 132.5, 131.3, 131.0, 129.8, 116.0, 62.9, 46.5, 43.6, 34.7, 34.4, 31.8, 28.6, 14.2. HRMS (ESI) $m / z:[\mathrm{M}+\mathrm{Na}]^{+}$calcd for $\mathrm{C}_{21} \mathrm{H}_{21} \mathrm{NaNO}_{5} \mathrm{~S}$ 422.1033, found 422.1003.

A mixture of [2.2]paracyclophane-derived cyclic $N$-sulfonylimine 4a ( $63 \mathrm{mg}, 0.20 \mathrm{mmol}$ ), sulfonium salt $2 \mathrm{~d}(91 \mathrm{mg}, 0.40 \mathrm{mmol}, 2.0$ equiv) and potassium carbonate ( $83 \mathrm{mg}, 0.60 \mathrm{mmol}, 3.0$ equiv) in acetonitrile ( 2.0 mL ) and $\mathrm{N}, \mathrm{N}$-dimethylformamide ( 2.0 mL ) was stirred at $15{ }^{\circ} \mathrm{C}$ for 12 h . Then ethyl acetate $(10 \mathrm{~mL})$ and water ( 10 mL ) were added to the mixture. The organic layer was separated and the aqueous layer was extracted with ethyl acetate $(10 \mathrm{~mL} \times 3)$. The combined organic layer was dried by anhydrous sodium sulfate, and concentrated under the reduced pressure. The residue was purified by flash chromatography on silica gel using hexanes and ethyl acetate as the eluent to give the corresponding aziridination product $\mathbf{5 b}$. The structure of product $\mathbf{5 b}$ was assigned by single crystal X-ray diffraction analysis; the CCDC number is 2107835 .
N,N-Dimethyl 1,8b-Dihydro-azirino[1,2-c][2.2]paracyclophano-[5,6-d][1,2,3]oxathiazina-1-carboxamide-3,3-dioxide ( 5 b ). 60 mg , $75 \%$ yield, $>20: 1 \mathrm{dr}$, white solid, $\mathrm{mp}=196-198^{\circ} \mathrm{C}$, new compound, $R_{\mathrm{f}}=0.50$ (hexanes/ethyl acetate $\left.=1: 1\right) .{ }^{1} \mathrm{H}$ NMR $\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right)$ $\delta 7.00-6.94(\mathrm{~m}, 1 \mathrm{H}), 6.78-6.72(\mathrm{~m}, 1 \mathrm{H}), 6.66-6.57(\mathrm{~m}, 2 \mathrm{H}), 6.55$ $(\mathrm{d}, J=7.9 \mathrm{~Hz}, 1 \mathrm{H}), 6.44(\mathrm{~d}, J=7.9 \mathrm{~Hz}, 1 \mathrm{H}), 4.19(\mathrm{~d}, J=4.0 \mathrm{~Hz}, 1 \mathrm{H})$, $3.51(\mathrm{~d}, J=4.0 \mathrm{~Hz}, 1 \mathrm{H}), 3.43-3.28(\mathrm{~m}, 2 \mathrm{H}), 3.26-3.11(\mathrm{~m}, 6 \mathrm{H})$, $3.02(\mathrm{~s}, 3 \mathrm{H}), 3.01-2.89(\mathrm{~m}, 2 \mathrm{H}), 2.84-2.74(\mathrm{~m}, 1 \mathrm{H}) .{ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\}$ NMR $\left(100 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta: 163.7,148.8,140.6,139.7,138.4,136.2,133.6$, 132.7, 132.2, 130.7, 130.3, 129.6, 117.2, 47.1, 44.8, 37.2, 36.1, 34.5, 34.1, 31.8, 28.8. HRMS (ESI) $m / z:[M+H]^{+}$calcd for $\mathrm{C}_{21} \mathrm{H}_{23} \mathrm{~N}_{2} \mathrm{O}_{4} \mathrm{~S}$ 399.1373, found 399.1373.

A reaction mixture of $N$-sulfonylimines $\mathbf{4 b}$ ( $52 \mathrm{mg}, 0.20 \mathrm{mmol}$ ), sulfonium salt 2 a ( $91 \mathrm{mg}, 0.40 \mathrm{mmol}, 2.0$ equiv) and potassium carbonate ( $83 \mathrm{mg}, 0.60 \mathrm{mmol}, 3.0$ equiv) in acetonitrile ( 2.0 mL ) and $N, N$-dimethylformamide $(2.0 \mathrm{~mL})$ was stirred at $15^{\circ} \mathrm{C}$ for 12 h . Then ethyl acetate $(10 \mathrm{~mL})$ and water $(10 \mathrm{~mL})$ were added to the mixture. The organic layer was separated, and the aqueous layer was extracted three times with ethyl acetate ( $10 \mathrm{~mL} \times 3$ ). The combined organic layer was dried over anhydrous sodium sulfate and concentrated under reduced pressure. The residue was purified by flash chromatography on silica gel using hexanes and dichloromethane as eluent to give the corresponding aziridination product 5 c.
8b-Phenyl-1,8b-dihydroazirino[1,2-c]benzo[e][1,2,3]-oxathiazine-1-carboxylate-3,3-dioxide (5c). 65 mg , $94 \%$ yield, > $20: 1 \mathrm{dr}$, white solid, $\mathrm{mp}=54-56{ }^{\circ} \mathrm{C}$, new compound, $R_{\mathrm{f}}=0.50$ (hexanes/ethyl acetate $=2: 1) .{ }^{1} \mathrm{H}$ NMR $\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.50-$ $7.42(\mathrm{~m}, 5 \mathrm{H}), 7.42-7.35(\mathrm{~m}, 1 \mathrm{H}), 7.19-7.11(\mathrm{~m}, 2 \mathrm{H}), 7.06-6.98$ $(\mathrm{m}, 1 \mathrm{H}), 4.27(\mathrm{~s}, 1 \mathrm{H}), 4.14-3.93(\mathrm{~m}, 2 \mathrm{H}), 0.98(\mathrm{t}, J=7.1 \mathrm{~Hz}, 3 \mathrm{H})$. ${ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\}$ NMR ( $100 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta: 164.1,149.1,132.2,131.0$, 130.6, 129.6, 129.0, 128.9, 126.8, 121.6, 119.8, 62.4, 58.3, 49.2, 13.8. HRMS (ESI) $m / z:\left[\mathrm{M}+\mathrm{NH}_{4}\right]^{+}$calcd for $\mathrm{C}_{17} \mathrm{H}_{19} \mathrm{~N}_{2} \mathrm{O}_{5} \mathrm{~S}$ 363.1009, found 363.1000 .
Reduction of Dearomatized Product 3a. Sodium tetrahydroborate ( $38 \mathrm{mg}, 1.00 \mathrm{mmol}, 5.0$ equiv) was added to a solution of 3 a $(95 \mathrm{mg}, 0.20 \mathrm{mmol})$ in tetrahydrofuran $(3.0 \mathrm{~mL})$. The reaction was performed at room temperature for 1 h . The reaction mixture was quenched by the addition of saturated aqueous ammonium chloride solution $(10 \mathrm{~mL})$. After being extracted with dichloromethane ( 10 $\mathrm{mL} \times 3$ ), the combined organic layer was dried by anhydrous sodium sulfate and concentrated under reduced pressure. The diastereomeric ratio of the product 6 was determined by ${ }^{1} \mathrm{H}$ NMR analysis. The
solvent was removed under reduced pressure; the residue was purified by flash chromatography on silica gel using hexanes and dichloromethane as eluent to give the desired reductive product 6.

Ethyl 4-Phenyl-4,6a,7,7a-tetrahydro-3H-(5,7a)-cyclopropa[3,4]-benzo[1,2-e][1,2,3]oxathiazina-(1,4)-benzenacyclohexaphane-7-carboxylate-2,2-dioxide (6). $91 \mathrm{mg}, 95 \%$ yield, > $20: 1 \mathrm{dr}$, white solid, $\mathrm{mp}=227-229^{\circ} \mathrm{C}$, new compound, $R_{\mathrm{f}}=0.30$ (hexanes/dichloromethane $=1: 1) .{ }^{1} \mathrm{H}$ NMR $\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.36-7.29(\mathrm{~m}, 4 \mathrm{H})$, $7.26-7.22(\mathrm{~m}, 1 \mathrm{H}), 7.18-7.13(\mathrm{~m}, 1 \mathrm{H}), 7.12-7.06(\mathrm{~m}, 2 \mathrm{H}), 6.85-$ $6.79(\mathrm{~m}, 1 \mathrm{H}), 5.15(\mathrm{~d}, J=8.3 \mathrm{~Hz}, 1 \mathrm{H}), 4.84(\mathrm{~d}, J=6.8 \mathrm{~Hz}, 1 \mathrm{H})$, 4.26-4.11 (m, 3H), 3.19-2.97 (m, 2H), 2.91-2.76 (m, 1H), 2.68$2.47(\mathrm{~m}, 2 \mathrm{H}), 2.38-2.25(\mathrm{~m}, 1 \mathrm{H}), 2.00-1.74(\mathrm{~m}, 3 \mathrm{H}), 1.41(\mathrm{~d}, J=$ $5.9 \mathrm{~Hz}, 1 \mathrm{H}), 1.30(\mathrm{t}, J=7.1 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\}$ NMR $(100 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right) \delta: 172.5,153.8,139.8,138.2,137.1,131.7,131.6,131.5$, 131.33, 131.26, 129.52, 129.49, 128.6, 128.0, 109.5, 61.4, 60.2, 34.8, 34.4, 33.8, 33.3, 31.6, 27.9, 25.5, 14.5. HRMS (ESI) $m / z:[\mathrm{M}+\mathrm{H}]^{+}$ calcd for $\mathrm{C}_{27} \mathrm{H}_{28} \mathrm{NO}_{5} \mathrm{~S}$ 478.1683, found 478.1681.

Ring-Opening of Dearomatized Product 3a. To a solution of compound 3a ( $48 \mathrm{mg}, 0.10 \mathrm{mmol}$ ) in dichloromethane $(3.0 \mathrm{~mL})$ was added boron trichloride ( $90.0 \mu \mathrm{~L}, 117 \mathrm{mg}, 0.20 \mathrm{mmol}, 2.0$ equiv) was added dropwise. After 10 min , aqueous dimethylamine ( $0.20 \mathrm{~mL}, 1.00$ $\mathrm{mmol}, 33 \mathrm{wt} \%, 10$ equiv) was added at $0{ }^{\circ} \mathrm{C}$. The reaction was performed at room temperature for 2 h , saturated aqueous ammonium chloride solution ( 10 mL ) was added to the mixture. The organic layer was separated and the aqueous layer was extracted three times with dichloromethane ( $10 \mathrm{~mL} \times 3$ ). The combined organic layers were dried over anhydrous sodium sulfate, filtered and concentrated under the reduced pressure. Then, the crude residue was purified by flash chromatography on silica gel using hexanes and ethyl acetate $(20 / 1-6 / 1)$ as eluents to give the desirable ring-opening product 7. The structure of product 7 was assigned by single crystal X-ray diffraction analysis; the CCDC number is 2111966.

Ethyl 4-(((N,N-Dimethylsulfamoyl)amino)(phenyl)methylene)-5-oxo-(3,6)-bicyclo[4.1.0]heptana-(1,4)-benzenacyclohexaphan-2-ene-7-carboxylate ( 7 ). $42 \mathrm{mg}, 81 \%$ yield, yellow solid, $\mathrm{mp}=171-$ $173{ }^{\circ} \mathrm{C}$, new compound, $R_{\mathrm{f}}=0.40$ (hexanes/ethyl acetate $=5: 1$ ). ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 12.02(\mathrm{~s}, 1 \mathrm{H}), 7.71-7.60(\mathrm{~m}, 1 \mathrm{H}), 7.53-$ $7.36(\mathrm{~m}, 2 \mathrm{H}), 7.32-7.28(\mathrm{~m}, 1 \mathrm{H}), 7.11-6.95(\mathrm{~m}, 2 \mathrm{H}), 6.91-6.79$ $(\mathrm{m}, 2 \mathrm{H}), 6.72-6.64(\mathrm{~m}, 1 \mathrm{H}), 5.01(\mathrm{~d}, J=6.8 \mathrm{~Hz}, 1 \mathrm{H}), 4.22-4.02(\mathrm{~m}$, $2 \mathrm{H}), 3.15-3.01(\mathrm{~m}, 1 \mathrm{H}), 2.94-2.81(\mathrm{~m}, 1 \mathrm{H}), 2.72-2.58(\mathrm{~m}, 2 \mathrm{H})$, $2.50(\mathrm{~s}, 6 \mathrm{H}), 2.38-2.25(\mathrm{~m}, 1 \mathrm{H}), 2.05(\mathrm{dd}, J=6.6,5.7 \mathrm{~Hz}, 1 \mathrm{H})$, $1.93-1.79(\mathrm{~m}, 2 \mathrm{H}), 1.78-1.64(\mathrm{~m}, 1 \mathrm{H}), 1.24(\mathrm{t}, J=7.1 \mathrm{~Hz}, 3 \mathrm{H})$, 1.16-1.03 (m, 1H). ${ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\}$ NMR ( $100 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta: 199.7$, 169.9, 148.3, 139.1, 138.3, 134.5, 132.5, 131.5, 131.1, 130.9, 130.7, $130.5,130.1,128.4,128.2,115.8,61.4,37.3,36.6,36.2,35.5,34.1$, 31.3, 31.1, 25.0, 14.4. HRMS (ESI) $m / z:[\mathrm{M}+\mathrm{H}]^{+}$calcd for $\mathrm{C}_{29} \mathrm{H}_{33} \mathrm{~N}_{2} \mathrm{O}_{5} \mathrm{~S} 521.2105$, found 521.2100 .
